# Executive Summary

This project report focuses on transportation as a primary mode of expanding equitable access to recreation opportunities. The goals of our project, which follow from FPR's 2020 State Comprehensive Outdoor Recreation Plan (SCORP) priorities, are to increase equitable access to outdoor recreation, maximize transportation efficiency, and promote stewardship of Vermont public lands.

## Results

1. **Case Study Analysis** of how equitable access to recreational opportunities has been addressed elsewhere and which of those strategies might be transferable to Vermont. The two focal case studies include: Adirondack Park, New York and King County, Washington.
2. **ArcGIS “gap analysis”** of existing public transit and recreation opportunities to answer the questions:
  - a. Where is there public access land with recreation opportunities but no public transportation access?
  - b. Where is there public transportation access to public land but no recreation opportunities?
3. **Synthesis** of case study strategies, GIS results and informed suggestions to Vermont FPR regarding how to best identify and design projects aimed at equitable transportation access to public lands.

## Conclusions

1. The GIS gap analysis revealed over 70 recreation sites and almost 800 public access land parcels with opportunities for FPR to improve transportation and recreation infrastructure. This could involve the creation of new stops at recreation access points near existing bus routes.
2. Increased access should be balanced with public land stewardship. Given that the improvement of recreational opportunities will likely increase use, proactive management plans for public lands are essential. They should take into account the ecological impacts of increasing access to certain areas, the ability of small Vermont communities to absorb increased visitation, and collaboration to achieve equity and access goals.
3. Inadequate parking at trailheads in Vermont is a symptom of a larger infrastructure problem. Improved public transportation access to recreation opportunities will mitigate parking challenges, reduce personal vehicle carbon emissions, and increase access for those without vehicles.
4. The COVID-19 pandemic has intensified disparities in equity and access to outdoor recreation in Vermont and in our society, reinforcing the importance of an equity-centered approach to public lands management and recreation policy.

## Limitations and Future Research

Information identifying where expanded recreation infrastructure would be favorable, based on public interests and desires, would benefit any continuation of this project. Our spatial analysis could be extended through the creation of an access point layer, allowing a finer-scale analysis of distance between access points on public land parcels and public transportation routes. Additionally, the incorporation of more comprehensive recreation site data, visitation data, and parking data, could enhance the “gap analysis” identification of parcels and sites. Lastly, financial and infrastructural feasibility of increasing access to specific recreation areas should be considered in future research.

# Introduction

Vermont is nationally known for its beautiful natural landscapes. The state's vast forests, mountains, and watersheds provide ample grounds for outdoor recreation activities such as skiing, hiking, and biking. Forests cover 4,591,281 acres of land in Vermont, accounting for 78 percent of the state. Vermont has a small percentage of public land, with more than 80 percent of forested land owned by individuals and families (*Department of Forests, Parks and Recreation*). The Vermont Department of Forests, Parks, and Recreation (FPR) is responsible for maintaining State Parks and State Forests, and acquiring and coordinating land under the Agency of Natural Resources. In addition, the FPR oversees and supports outdoor recreation for both local Vermonters and the millions of visitors that travel to the state each year to enjoy the scenic landscapes. FPR's management plan for monitoring Vermont's recreation is summarized in its most recent 2020 Statewide Comprehensive Outdoor Recreation Plan (SCORP). Due to constantly shifting demographics, environmental conditions, public interests, and recreation trends, the state develops a new plan every five years, utilizing public surveys and commentary opportunities to address the ever-changing needs of Vermonters (*Department of Forests, Parks and Recreation*).

Our project focuses on two of the SCORP 2020 priorities and guiding principles: (1) "public participation and access for all" and (2) "stewardship of natural resources and recreation areas" (*Vermont Statewide Comprehensive Outdoor Recreation Plan*, 2019). Additionally, a major priority for FPR is addressing inadequate or inappropriately sited parking. Our partners at Vermont FPR believe that issues surrounding parking represent a larger array of challenges centered around getting the public to outdoor recreation spaces in an equitable and sustainable way. Keeping these guiding principles in mind, our project team focused on addressing equitable access to recreation opportunities, maximizing transportation efficiency, and promoting stewardship of public lands in Vermont.

To provide valuable context and guide suggestions that we offer our community partners at FPR, we researched other national or state-level projects aimed at increasing equitable access to public lands while simultaneously promoting stewardship for those lands. We were especially interested in projects whose strategies could be applied to a Vermont context. With these criteria in mind, we settled on two state-level case studies in Washington and New York that we believe will provide beneficial insights to future projects that FPR might pursue regarding equitable and sustainable transportation access to Vermont public lands. To complement our out-of-state case study research, we used ArcGIS to conduct a spatial analysis of public lands, recreation facilities, existing public transit routes and stops, and recreation-use data. Using these data, we performed a "gap analysis" to determine: (1) where public transportation exists but public access to recreation is limited and (2) where access to public land exists (trailhead, parking lots, etc.) but is not served by public transportation. Based on these findings, we further focused our analysis on several key locations that we believe could benefit from increased transportation access or recreation opportunities.

Finally, we brought together our findings from the case studies and GIS analysis to provide preliminary suggestions to Vermont FPR on how to best identify and design projects aimed at equitable transportation and access to public lands. Embedded in this analysis are considerations for the possible burdens any such initiatives may have on the carrying capacity of public lands or relevant budgets. Ultimately, this project is about forging a positive relationship between Vermonters and the outdoors, for the greatest number of Vermonters and at the lowest environmental cost.

# Part I: Case Studies

## Introduction

In order to present the FPR with the most comprehensive outline for potential strategies for increasing access to outdoor recreation, a case study analysis was utilized. This analysis includes the High Peaks Wilderness area in New York State's Adirondack Park, and King County in Washington State, areas that mirror Vermont's priority of increasing equity, access, sustainable infrastructure and stewardship of public lands. While Vermont will undoubtedly require solutions tailored specifically to the priorities of FPR and the needs of its citizens, research from other states engaging with issues of equity and access will provide useful insights into how to implement similar strategies on Vermont public lands. Our partners suggested looking into King County, Washington, an area focused primarily on public transportation and equitable access, as one case study. After some probing research, we settled on a second case study that focused on the High Peaks region in Adirondack Park in New York State, a relatively local example that offers understanding as to how to approach public land management multilaterally, combining economic vitality, ecosystem stewardship, sustainable infrastructure, and equitable access considerations. These two case studies provide important context that effectively supplement the findings from the GIS gap analysis. To conduct our research, we relied on publicly available documents, articles and studies. Initially, we hoped to conduct interviews with, and gather direct data from some of the municipal, transport, and outdoor recreation managers in both the Adirondacks and King County, but due to the mid-semester COVID-19 disruption, we were unable to do so.

## Case Study One: Recreation Management in High Peaks Wilderness Complex, New York State

The skyline of New York State's Adirondack mountains is an iconic sight that greets visitors as they approach the area from any direction. Like Vermont, the peaks, valleys, lakes and forests of the Adirondacks are a popular attraction for recreational tourists from all over the country. Created in 1892, as one of the first Forever Wild Forest Preserves, Adirondack Park encompasses 6 million acres and is the largest publicly protected area in the contiguous United States (Visit Adirondack 2020). The Park is not a National Park, nor is it completely a State park. Rather, the Adirondacks is a combination of state-owned lands (roughly 43 percent or 2.6 million acres), and privately-owned lands reserved for forestry, agriculture and open space recreation (roughly 3.4 million acres) (Visit Adirondack 2020). Within the park, over 100 towns and villages offer unique scenery, history, and opportunities for visitors to enjoy the protected landscape (Visit Adirondack 2020). This intricate blend of private and public ownership in addition to the diversity of land uses provides a unique framework for collaboration among multiple stakeholders to ensure the enduring beauty and health of the park while also increasing equitable access to outdoor recreation. More than 12 million visitors come to the park every year, and the proliferation of tourism, particularly in the High Peaks Wilderness Area is creating a mounting burden on local communities, infrastructure, and the very nature that the visitors come to see (Mann 2019).

**Figure 1.** Map of Adirondack Park (Image Retrieved from Pinterest).

## Increased Visitation and its Impacts on the High Peaks Area and Surrounding Communities

In the last two decades, the exponential increase of outdoor recreation in the park has strained local communities, infrastructure, and the health of the lands themselves, leading park and county officials to actively manage these challenges while maintaining high quality access to public lands for as many people as possible (Mercer 2019, September 9). The most visible sign of increased visitation is the proliferation of motor vehicles at trailheads, parking areas and roadsides, which creates a dangerous interface between pedestrians and traffic. The safety of visitors to the area is the primary goal of initiatives by state and local officials to ease parking congestion. On Route 73, one of the major access points to popular trailheads in the High Peaks, cars spill out of pullouts and line the winding roadside for miles, forcing hikers to walk from their cars to the trailheads (Izzo 2020). This presents an imminent danger to hikers walking on Route 73, where the speed limit is 55 miles per hour (Izzo 2020). Parking overflow is not unique to the small pullouts on Route 73, rather, a study by the Adirondack Council found that "close to 80 percent of all trailheads leading into the High Peaks and surrounding Wilderness areas were routinely above their capacity on fall weekends" (Figura 2018). Furthermore, the study found that close to 40 parking lots designed to accommodate *fewer* than 1,000 cars were frequently crammed with more than double their capacity, with cars parked along roadways and on private property (Figura 2018) (Adirondack Council 2018).

The Department of Environmental Conservation attributes a large portion of this congestion to the “I Love NY” campaign, which spends \$50 million annually encouraging travel across the state and aggressively marketing the Adirondack Park (Mercer 2019, Oct. 7). The increased traffic mirrors an increase of hikers and other recreators in the park. For example, according to data from the Adirondack Council, in 2000, the Cascade Trail registered less than 5,000 hikers each year. By 2016, the number of hikers had skyrocketed to almost 35,000. This is a 600% increase in hikers in less than two decades and represents a trend visible across many trails in the park. In New York State, there is an increasing demand for outdoor recreation opportunities as well as an increased awareness about providing equitable access to those opportunities for all who want them. Growing demand requires an urgent need for collaborative management between stakeholders who oversee recreation areas in the Adirondacks (Mercer 2019, September 9). Presently, the High Peaks Area is managed under guidelines from the second amendment to the High Peaks Complex Unit Measurement Plan (UMP) originally developed in 1999 (NYSDEC HPCUMP 2018). To alleviate the challenge of rapid visitation growth described above, state, county and park officials have proposed a series of short-term and long-term solutions guided by the High Peaks Complex UMP that are aimed at ensuring the safety of visitors, increasing low-cost access to trailheads, educating visitors on best practices, and maintaining the integrity and health of the Park ecosystem. Part three of the Amendment outlines six main management practices that are critical to successful long-term sustainability of recreational wildlands. The six guidelines are outlined below, along with how they have been put into practice to address the growing visitation to the park and the management challenges this presents.

### *1. Planning & Partnerships*

Planning, partnerships and collaboration are all essential components of an effective wildlands management plan, especially in an area like the Adirondacks that consists of a combination of public and private lands, and supports a wide range of land uses. Another important part of effective management is a plan that reflects the current needs and priorities of the High Peaks Wilderness Complex. As mentioned above, the original UMP for the High Peaks was drafted in 1999, more than two decades ago, and was only recently updated through a Second Amendment in July 2018 (NYSDEC HPCUMP 2018). When assessing some of the current challenges in the High Peaks, specifically regarding parking, non-profit Adirondack Council director William Janeway remarked that many of the proposals in the decades old management plan were never implemented, including plans for increased parking that could have alleviated the current problem (Mercer 2019, September 9). Updating the management plan is a crucial step because of how drastically the Park has grown and developed, and the increasing need for management practices that address contemporary challenges, and better prepare the area for long-term sustainability.

### *2. Education and Outreach*

Education and outreach is one of the main priorities of land managers in the Adirondacks because it engages visitors and empowers them to be stewards of the lands they are enjoying. The largest and most effective education and outreach tool is the Summit Stewardship Program (Figure 4), created in 1989 as a partnership between the Adirondack Mountain Club, the Adirondack Chapter of The Nature Conservancy, and the NYS Department of Environmental Conservation. The primary goals of this program are three-fold: educate the public about alpine ecosystems, maintain trails (priority to those above treeline), and conduct research on trail and ecosystem health (Summit Stewards 2019). Summit Stewards are stationed on popular mountaintops, such as Mt. Marcy and Algonquin, and interact informally on a person-to-person level, educating hikers about fragile alpine plants and inspiring them to take personal stewardship of summits and trails (Summit Stewards

2019). Recently, this program was expanded to include the Frontcountry Steward Program, which stations “stewards” at trailheads to educate visitors on wilderness principles such as ‘Leave No Trace’ before they head onto the trails (Frontcountry Stewards 2019; Rowland 2020; Westcott 2019). Frontcountry stewards help hikers understand regulations and are increasingly directing visitors to lesser known or newly designated trails to spread out use and reduce the strain on popular areas (Figura 2018). This complements efforts by the Regional Office of Sustainable Tourism, which along with other organizations, is helping to steer tourists to new or underused, but equally as scenic, areas of the park (Mercer 2019, September 9). New acquisitions of land and recently classified tracts such as Macintyre and Boreas Pond tracts, provide opportunities to spread out use (Adirondack Council 2018). This is not without complication, however, since redirecting people also requires increasing infrastructure, signage and access to less popular areas and properly managing these alternatives as they become more popular (Adirondack Council 2018).

**Figure 4.** Summit Steward explaining alpine ecology to a hiker (Summit Stewardship Program, 2019).

### *3. Front Country Infrastructure*

As discussed above, congestion in parking lots and on roadsides is a primary concern of state, local, and park officials because it presents managers with challenges for ensuring visitor safety as well as determining if and where parking congestion is representative of congestion and deteriorated conditions on trails.

#### *a. Parking Lot Limits and Roadside Bans*

An immediate, short term solution that was implemented in the High Peaks Wilderness is a State ban on roadside parking on Route 73, which is the major access point to the most popular hikes in the wilderness area (Figures 5 and 6). The ban, which is supported by the Department of Environmental Conservation (DEC) and the Department of Transportation, is aimed at “improving pedestrian safety along the corridor” (Izzo 2020; Mercer 2019). The parking ban imposed on four miles of the highway, from Rooster Comb trailhead to Chapel Pond Trailhead, is enforced by State Police, Essex County Sheriffs and Park Rangers, and those who park

illegally can expect to receive a fine or ticket (O'Brien 2019; Mann 2019). In addition, parking enforcement will be increased on roads leading to popular parking lots, such as the Adirondack Loj Road in North Elba, NY, in an effort to keep them at capacity (Mercer 2019, Oct. 7).

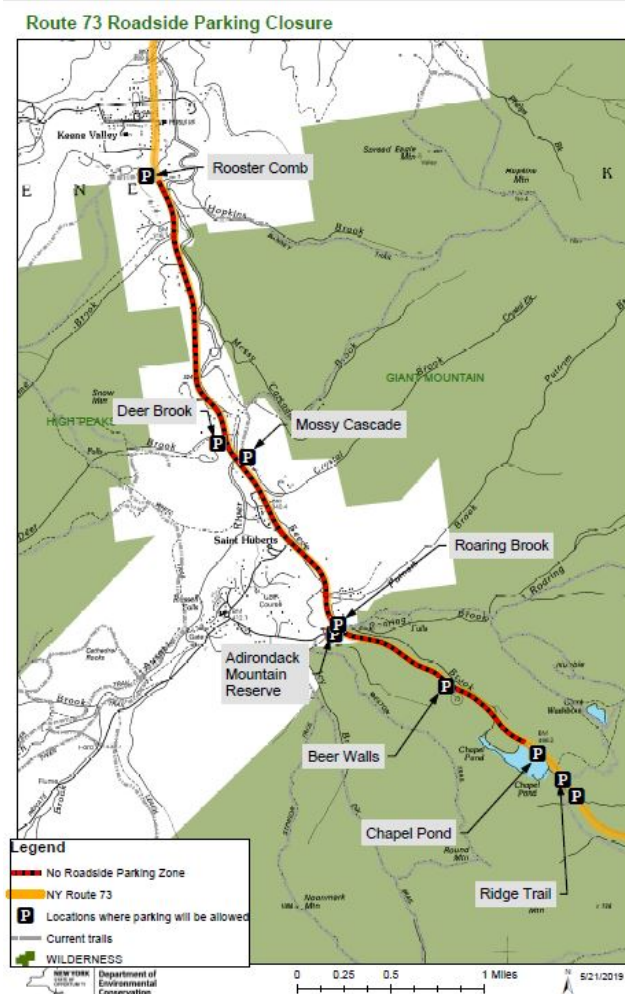

**Figure 5.** Cars packed onto the roadside in North Elba, NY (O'Brien, 2019).

The parking ban has had mixed success and is clearly not a viable long-term solution. Firstly, the parking bans are extremely difficult to enforce, and many visitors choose to park illegally unless there is physical law enforcement presence on the roadside and in designated lots (Mercer 2019, Oct. 7). In the two years since the ban was implemented, even visitors who were ticketed for parking illegally (with fines up to \$175) were often not successfully dissuaded from parking illegally in the future (Mercer 2019, Oct. 7). Furthermore, according to Adirondack Council director William Janeway, the emphasis on enforcing parking bans is taking personnel and resources away from trail maintenance and stewardship in heavily used areas (Mercer 2019, September 9).

#### a. Parking Hubs and Shuttles

In addition to strict enforcement on parking lot limits, the DEC is looking to increase the size of some of the busiest parking areas or relocate them to centralized parking 'hubs'. The parking 'hubs' would be connected to popular areas via new or re-routed trails or shuttles to reduce parking congestion on roadsides and increase access points for hikers (Adirondack Council 2018). One such shuttle is the High Peaks Trail Shuttle that is slated to start running in the summer of 2020. The proposed bus system would shuttle hikers along Route 73 (where the parking ban is currently in place) from new parking lots at Mount Van Hoevenberg all the way south to the High

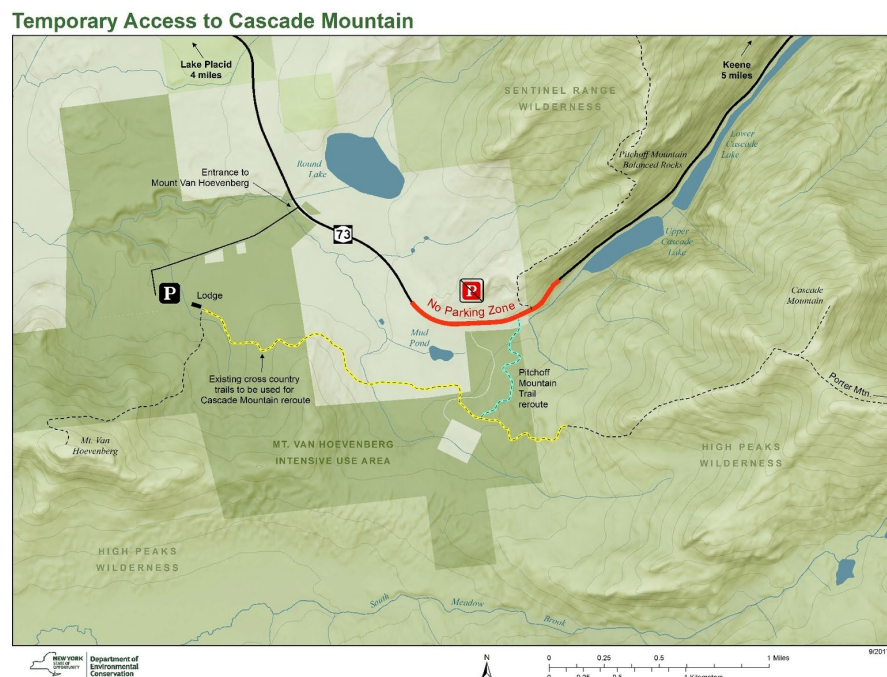

**Figure 6.** Map of 4-mile parking ban on Route 73 which services many popular trails in the High Peaks (NYSDEC).

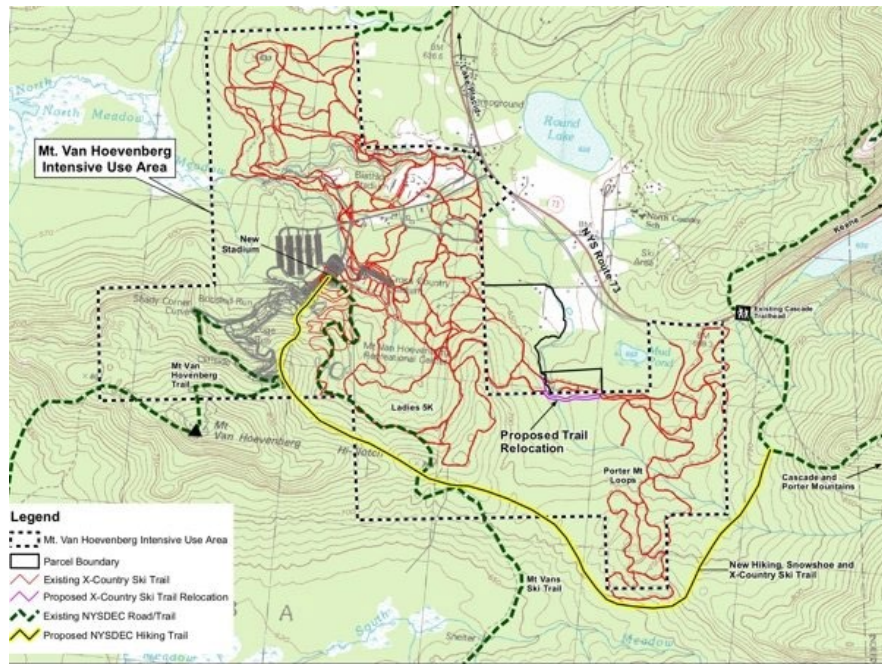

Peaks and Giant Mountain Wilderness (Izzo 2020). The ‘no pay’ shuttle will run 16 hours a day and stop at every major trailhead every 30 minutes from July until Labor Day (Izzo 2020). The project is supported by \$1.2 million dollars in state funding, in addition to contributions from the Department of Environmental Conservation and Keene and Essex Counties (Izzo 2020). This shuttle will complement the Garden Shuttle that already operates in Keene Valley and has struggled to keep up with the influx of hiker traffic (Izzo 2020). The High Peaks shuttle will help to reduce the number of hikers walking along roadsides to access trailheads and will make Keene Valley ‘safe and more user-friendly’ (Rowland 2020). According to Keene Valley Supervisor Joe Pete Wilson, the shuttle system represents a “trend toward relatively inexpensive yet accessible recreation” that will aid in promoting sustainable tourism in the High Peaks (Adirondack Council 2018; O’Neil 2019).

#### 4. Backcountry infrastructure

One project to improve backcountry infrastructure is the Mt. Hoevenberg East Trail, which was recently designated to reduce hiker congestion in the High Peaks. The 1.7-mile trail, located in North Elba, starts at the Olympic Sports Complex at Mount Van Hoevenberg (Figure 7 and 8) (DEC 2018). The DEC is also set to begin building a new trail up Cascade Mountain and the new East Trail will provide access to this new trail. As outlined in the 2018 High Peaks Complex UMP Amendment, once the new trails are complete, the DEC plans to close the current Cascade Mountain Trailhead located off Route 73 (DEC 2018). This project represents an example of possible solutions when there is no physical room for parking expansion. Furthermore, all new trails in the High Peaks, and especially those in high-traffic areas are being built to sustain more use and decrease erosion (DeMola 2018). The Mt. Hoevenberg East Trail is part of a comprehensive effort to “promote sustainable tourism and address public safety in the Adirondacks” (DEC 2018). The DEC hopes that through projects like this one, hikers will have a safe and adequate place to park in order to access a well-built and sustainable trail that leads them to scenic views (DEC 2018).

**Figure 7.** Map of no-parking zone along Route 73 and temporary reroute to Cascade Mountain. Courtesy of NYS DEC.

**Figure 8.** Map of Mt. Van Hoevenberg trails with proposed reroute highlighted in yellow. Courtesy of the Olympic Regional Development Authority

*5. Limits on use when all else fails: When education and outreach along with appropriate infrastructure improvements cannot support the carrying capacity*

Officials in the Adirondacks are aware of the limited success of parking bans and are working to create a “comprehensive management plan” to restrict the number of hikers accessing the High Peaks (Mercer 2019, Oct. 7). Officials have proposed a variety of projects that include mandatory hiker registration at trailheads to help the DEC understand the number of visitors and where they are from, increasing the number of areas that enforce group size limits, directing visitors to alternative, less used areas, and even implementing a permitting system for the High Peaks Area (Figura 2018; Mercer 2019, September 9). Because our project is focused on increasing access for all, it is important to note that while implementing a use or entry fee could alleviate environmental impacts, it raises equity issues for low-income visitors (Lamborn et al. 2017). Increasing entry fees and reducing use could also have economic effects on local communities who rely heavily on tourists (Allen 2019 p.9).

*6. Resources both personnel and funding: Includes staff to facilitate management, maintenance and safety concerns and appropriate funds to maintain and educate and expand opportunities for partnerships.*

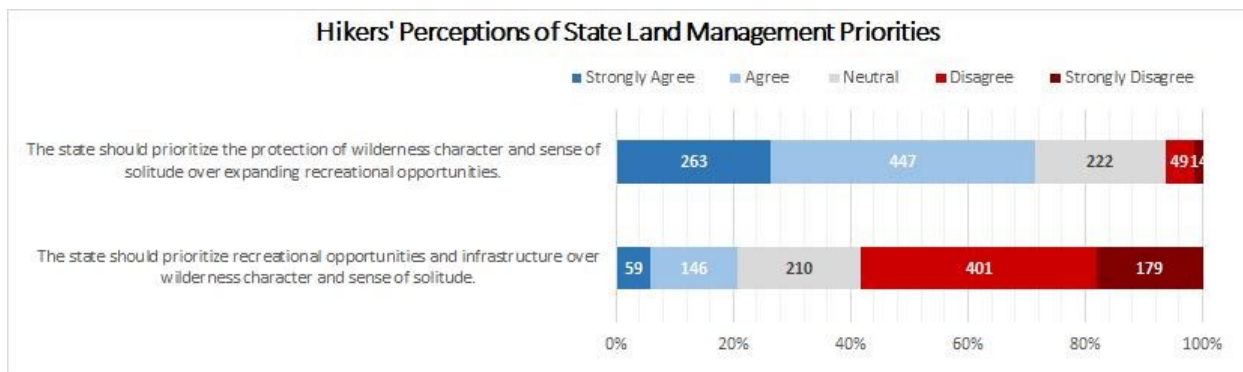

Funding is an extremely important aspect of public land management and many of the projects described above would not be possible with adequate funding and staff to implement them. New York State contributes a considerable amount of funding to the promotion and management of the Adirondacks, including \$400 million on capital projects, land acquisitions, and infrastructure improvements (Mercer, 2019, September 9th). New York State has also invested \$50 million per year in the “I Love NY” campaign, which encourages tourism across the state and particularly on public lands (Mercer 2019, October 7th). Furthermore, the state has contributed \$1.2 million to the High Peaks Shuttle that is proposed for the summer of 2020 (Izzo 2020). A spokesperson for NY Governor Andrew Cuomo stated “the facts are clear: Governor Cuomo has invested

billions of dollars in the Adirondack Park to support its communities and make the park an international, sustainable tourist destination, preserving it for future generations" (Mercer, 2019, September 9th). The funding provided by the state has been an invaluable asset to implementing effective management projects and programs. However, it is clear that there needs to be more funding directed not only at increasing visitation to public lands like the High Peaks, but also at understanding the social and environmental impacts and implementing educational and infrastructure developments that increase *equitable and sustainable access*.

## **Increasing Demand & Holistic Park Management**

Parking bans, parking lot enforcement, and the creation of parking ‘hubs’ require park managers to ask more complex questions in order to effectively tackle the challenges associated with visitor growth. The first question to ask when deciding how to address parking congestion is whether the parking lot capacity is indicative of the size and capacity of the trail(s) it services. This is important because it will help managers identify whether the problem is too many cars parked unsafely in lots and on roadsides, or if there are too many people on specific trails. The challenge is thus: how do wildland managers identify where to increase or decrease the availability of parking access based on considerations of popular demand, trail conditions and durability, topographic/infrastructure limitations, and visitor safety and satisfaction?

The key to effectively answering this question is sufficient data. Officials know where vehicles exceed the safe limits of designated lots. While it is generally true that more traffic on trails damages plants and wildlife in addition to overwhelming trails, campsites and mountain summits, studies have shown that there is not always a directly correlated relationship between the amount of visitor use and environmental impacts (Adirondack Council 2018; Cole 2019). There is a paucity of data on how increased visitor use is perceived by the visitors themselves, through subjective social impact measurements, including perceptions of “crowding”. The concept of crowding is a value judgement about what density or number of encounters with other visitors is “too great” (Vaske and Shelby 2008). It is important to distinguish subjective perceptions of crowding from the objective number of people in a given area, especially when considering management decisions that limit access (Allen 2019, p.3; Manning 1999). For example, during a High Peaks forum, Town of Keene supervisor Joe Pete Wilson noted that “the problem has gotten to the point that the crowding, the parking, managing human waste, it’s so great, it’s starting to have a real negative impact on the visitor experience” (Lynch 2018). Wilson echoes the sentiments of many leaders of local Adirondack communities who are trying to balance healthy, sustainable tourism with the health of the landscape and the needs of their communities (Mercer 2019, September 9). The “crowding” that Wilson mentions is supported by personal observations of visitor increase and by results from a 2018 Hiker Survey aimed at assessing perceptions of overuse and management actions (Figures 9 and 10) (2018 Hiker Survey). The results showed that 80% of hikers wanted more educational materials about appropriate trail use and safety and 75% supported more funding to hire more DEC staff and rangers, particularly for maintenance needs. Respondents also largely agreed that the number of hikers should be limited at high-use locations and that trailhead parking should combine reservations and “first come first serve” to control the number of vehicles (2018 Hiker Survey).

**Figure 9.** Responses to the High Peaks Survey showing hikers feedback on potential management actions

**Figure 10.** Responses to Hiker Survey showing hikers' perceptions of State Land Management Priorities.

Managers depend on surveys like the 2018 Hiker Survey to understand the perceptions and priorities of visitors when determining “when social conditions at a recreation setting lead to unacceptable social impacts” (Allen, 2019, p.6). However, managers must use perceptions of social impacts as just one criterion of many when considering actions to reduce social and environmental impacts in recreation settings (Allen, 2019, p.9). This is especially important from an equity and access perspective because efforts to reduce impacts, such as fees, often disproportionately affect low-income or less-experienced visitors (Allen, 2019). However, only 1,200 groups were surveyed and only 11% of respondents were non-white, which provides limitations to how widely the data from the survey can be applied to solutions for equity and access (n.a. Results of hiker surveys 2018). These limitations parallel limitations in the survey data included in the Vermont SCORP, and this is one area where VT FPR can direct their attention to gain a better understanding of the priorities and needs of Vermonters when it comes to increasing equitable access. Managers should also collect data on where perceptions of crowding occur, what times of the week or season, the recreational priorities of visitors, opportunities to disperse visitors, and more (Allen, 2019, p.1).

Small communities like Keene Valley depend on the annual influx of tourists to the area, but often do not have the infrastructure or the data to effectively manage the sharp increase in visitors (O'Brien 2019).

Newcomb Supervisor Robin DeLoria explains, “A parking area full of cars clearly shows the need to expand the opportunities for our visitors, not the parking lots” (Adirondack Council 2018). While focusing on alleviating strain on parking in lots and on roadsides, it is critical to keep in mind what that reveals about the rising demand for access that challenges local communities as well as the health of wilderness areas. Neil Woodworth, the Executive Director of the Adirondack Mountain Club echoes Supervisor DeLoria’s concerns. He says, “I think it is clear that we need to do more than just keep parking lots small. We need to explore and employ all of the best management practices that are suited to the park” (Adirondack Council 2018). This emphasis on a holistic management approach is supported by various studies which show how a combination of use limits and visitor and site management strategies are often more likely to be effective in reducing local impacts than simply restricting use on its own (Cole 2). This holistic approach requires sufficient data to productively and equitably implement projects around parking, trailhead access and maintenance, mitigating social and environmental impacts, and ensuring long-term sustainability.

## Takeaways for the Vermont Context

The Adirondacks/High Peaks Complex case study has a number of management strategies that could be applied by FPR to Vermont public lands. This case study also highlights a few management shortcomings that could also provide insights into how to implement effective wildland management while increasing equitable access.

- **More Comprehensive Survey Data:** SCORP is a good start to outlining an effective management plan for Vermont Public Lands. However, in order for it to be a collaborative and dynamic plan that best delivers equitable access to visitors, SCORP needs a better foundation in survey data that equips wildland managers with a better understanding of who is (or is not) going where, how frequently, for what purpose, and what their priorities are for future land management. Incorporating comprehensive data into a comprehensive management plan that encourages local collaboration, and dynamic adaptation to evolving recreational demands and priorities is critical to providing a framework in which projects focused on increasing equity and access can be realized while also considering the ecological and economic capacities of diverse areas.
- **Relationship Between Use and Impacts:** While we must recognize the limitations and sensitivity of different ecosystems and their ability to absorb increased recreation, we must also be critical of implementing restrictions on access and consider who those restrictions would affect the most. One of FPR's main goals is to increase equity and access to public lands. A part of that is critically examining the words used to describe management challenges that arise and the solutions that are applied to them. Often words such as "carrying capacity" or "overcrowding" are stand-ins for management decisions that limit the recreational opportunities for people that have the least access to them in the first place. (*Allen*). In identifying how to disperse visitors across existing recreational sites, as well as in identifying where access to recreational sites can be increased, FPR should center an equity and data driven framework in order to effectively address parking challenges and natural resource stewardship priorities.
- **Parking Infrastructure and Parcel Development:** Our partners at FPR initially highlighted parking as an area to target in this project, because it tends to be a symptom of larger infrastructure and access problems. Fixing parking issues requires comprehensive data on visitor use and priorities, opportunities for increased public transportation access, and the social and environmental impacts associated with increasing or decreasing access to a given area. Additionally, with the help of GIS data, identifying underdeveloped or underused public land parcels is an effective way to relieve social and environmental impacts concentrated in popular recreation sites and increase access points to diverse recreational opportunities.

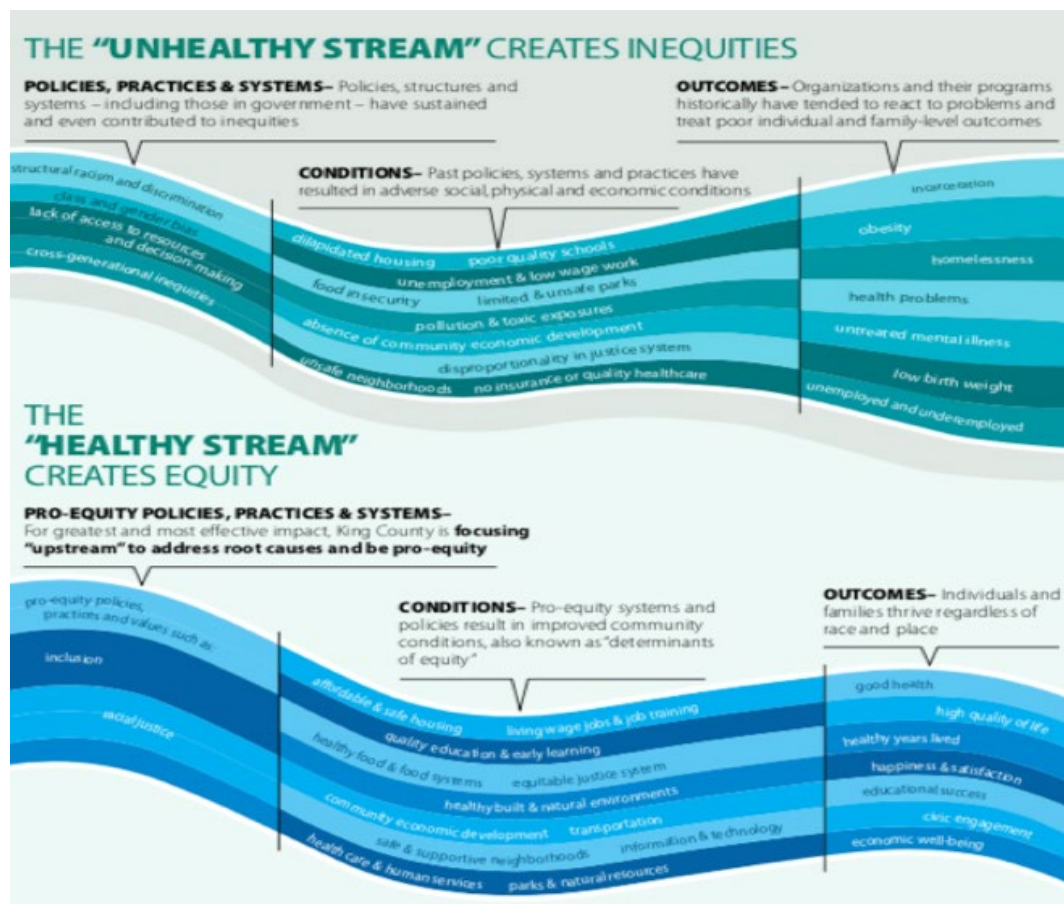

## Case Study Two: Transportation Equity and Recreation Access in King County, Washington

King County is home to the most populous and diverse population in Washington state. It's 21,130 square miles is comprised of urban areas such as Seattle, where 94% of its residents live, along with suburban and rural sprawl. This sprawl extends from the Puget Sound in the west, to Mount Daniel in Cascade Crest in the East, containing coastline, rivers, floodplains, mountains, plateaus, lakes, and salmon streams along the way. Lake Washington alone provides 35 square-miles of diverse aquatic ecosystems, while Vashon-Maury Island in the Puget Sound and Mercer Island in Lake Washington provide isolated, niche island ecosystems. Among this array of land is 175 miles of regional trails, 215 miles of backcountry trails, and over 26 natural park areas. Every four years, since 1994, King County releases a Comprehensive Plan geared towards promoting the wellbeing and preservation of the county's people and resources, outlining and updating the county's land developments and regulations, regional services, and priorities moving forward. Despite the longevity of these comprehensive plans, about 22%, or 500,000 of the county's 2.25 million residents, do not have access to the outdoor opportunities and the health and education benefits that these various landscapes have to offer.

### Equity and Access

King County, named after Dr. Martin Luther King Jr. prides itself on its commitment to equity and justice. In 2008, King County executive Ron Sims spearheaded the Equity and Social Justice (ESJ) initiative as part of the county's mission, culminating in the ESJ office branch in 2015. In 2016, the ESJ office produced the first official ESJ Strategic Plan, a six-year plan aimed at making sure all of the county's affairs are inclusive and collaborative, diverse and people focused, responsive and adaptive, transparent and accountable, racially just, and focused upstream where needs are the greatest (*Equity and Social Justice Strategic Plan*, 2016). The plan, seeking to establish higher levels of overall success as a county, is based on establishing a "healthy stream" of equity. This "healthy stream" refers to the pro-equity policies, practices, and systems that yield favorable determinants of equity- factors such as quality education, affordable housing, and healthy environments- and in turn provide promising outcomes where all individuals thrive, regardless of race and place (Figure 11).

Prior to the official establishment of King County's ESJ office, annual resident surveys conducted in 2009 and 2012 reported that 71% of respondents claimed satisfaction with regional parks and trails (Beatty & Foster, 2015). These results can be explained by a 2010 park access study that revealed affluent neighborhoods had almost twice the park access then that of low-income neighborhoods of color—these populations were not granted equitable access to outdoor recreation opportunities, and were not happy about it (Beatty & Foster, 2015). This discrepancy in access stems from unequal policies and systems, feeding the aforementioned "unhealthy stream," and urging King County to adopt its outdoor resources into the ESJ plan (Figure 11).

**Figure 11. Theory of change in equity building.** If equity is established in policies, practices, and systems, it will yield favorable conditions for all to thrive (*Equity and Social Justice Strategic Plan*, 2016).

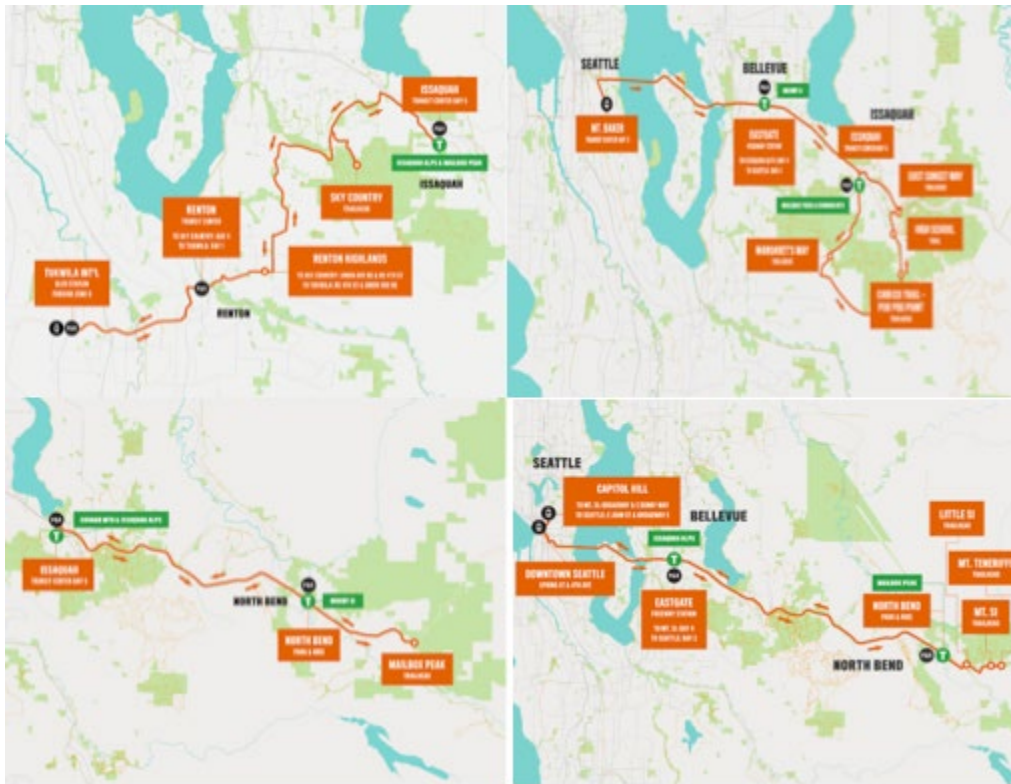

In 2015, the ESJ office conducted an investigation to establish the various determinants of equity, and where discrepancies would be found. The office established ESJ scores to quantitatively and spatially analyze these determinants of equity, and to inform the county's equity-disparity mitigation strategies. It was found that areas with higher ESJ scores, generally higher-income and less racially polarized communities, were closer to regional trailheads (Beatty & Foster, 2015). It was also found that residents of low ESJ-score communities rely more heavily on public transportation, indicating that hefty distances from trailheads makes access only more elusive, as opposed to those with higher ESJ-scores and private vehicles (Beatty & Foster, 2015). This relationship highlights transportation as a crucial measure in increasing access to outdoor recreation opportunities through equitable means.

## Transportation Centered Measures

King County is notorious for traffic, clocking in with the sixth worst traffic congestion in the United States. Despite this, the county boasts a pretty robust transportation system, serving urban, suburban, and rural areas alike. In order to combat inequities associated with access to outdoor recreation opportunities, along with other inequities plaguing King County's more vulnerable populations, various transit programs and incentives have come to fruition in recent years.

Trailhead Direct, a 2019 pilot program co-led by King County Metro and King County Parks, seeks to reduce vehicle congestion and safety hazards while expanding access to popular regional trailheads along I-90. These transit lines only operate seasonally, and on weekends and holidays, as they intend to serve the greatest number of individuals, including working populations that may only have time to recreate during non-traditional business hours. Additionally, under the motto “Park. Ride. Hike.” Trailhead Direct strives to create a consumer base of those, who without a direct transit option, would utilize personal vehicles to access recreation areas. Within its inaugural season, Trailhead Direct gained popularity via its easy-to-use mobile app, TOTAGO, that allows users to download offline transit and trail maps to plan trips, and its novel #trailheaddirect hashtag on Instagram. This program is both private and publicly sponsored by the REI Co-op and the Seattle Department of Transportation respectively, ensuring its longevity and support across numerous sectors that value outdoor recreation in their own right. Financial support aside, support for Trailhead Direct has also come from the City of Bellevue, City of Issaquah, City of North Bend, City of Renton, City of Tukwila, Eastside Fire and Rescue, ECOSS, Issaquah Alps Trails Club, Mountains to Sound Greenway Trust, REI Co-op, Si View Metropolitan Park District, The Mountaineers, The Wilderness Society, TOTAGO, U.S. Forest Service, Washington State Department of Natural Resources, and Washington Trails Association.

Going into only its second season, Trailhead Direct consists of four transit lines. The Cougar Mountain line provides riders access to the Sky County trailhead at Cougar Mountain regional wildland park. This line both starts and ends at Parking Zone G Tukwila International Boulevard Station, where it connects downstairs to a Link Light rail platform and a park and ride (Figure 12). The Issaquah Alps line starts and ends at Mount Baker Transit Center Bay 2, across the street from the Sound Transit’s Mount Baker Link light rail station on Rainier Avenue South. It services Margaret’s Way, Chirico Trail-Poo Poo Point, the High School Trail, and East Sunset Way trailheads, with additional stops at Eastgate Freeway Station and Issaquah Transit Center (Figure 12). The Mailbox Peak line starts and ends at the Issaquah Transit Center, stopping at North Bend Park-and-Ride, and servicing Mailbox Peak trailhead (Figure 12). Lastly, the Mount Si line services the Mount Si, Mount Teneriffe, and Little Si trailheads, with stops on First Hill, Fourth Avenue in downtown Seattle (near the University Street Link light rail station), Eastgate Freeway Station in Bellevue, and the North Bend Park-and-Ride. This line starts at a bus stop on Broadway and East Denny (across from Sound Transit’s Capitol Hill Link light rail station), and ends at a bus stop on East John Street and Broadway East (adjacent to Sound Transit’s Capitol Hill Link light rail station) (Figure 12).

**Figure 12. Trailhead Direct Transit Lines (*Trailhead Direct*).**

Trailhead Direct, as an affiliate of the Seattle Department of Transportation, operates within the regional fares scale, charging \$2.75 for adults (19+), \$1.50 for youth (6-18), \$1.00 for RFP cardholders (registered seniors, Medicare, disabled), and free for children up to the age of 5. Riders may pay on board with exact change, beforehand with the transit GO mobile app, or partake in the regional ORCA card system, in which low-income riders and students may qualify for fares of \$1.50.

### *Rapidride and DART*

RapidRide is King County's streamlined bus service. RapidRide buses operate similarly to trains, following the same line out and back, coming frequently (about every 10 minutes) so scheduling is never an issue, and running late nights, early mornings, and seven days a week. RapidRide buses also operate in HOV lanes, avoiding traffic, saving riders time, and serving as a popular alternative to traffic-prone personal vehicles. In addition, with RapidRide riders may pay before they board, eliminating stoppage time and increasing safety. RapidRide fares are consistent with the aforementioned Trailhead Direct fares. In efforts to connect riders with outdoor recreation opportunities, namely parks and regional trails in more urban areas, RapidRide buses and stations are equip with bike racks, making it easy for riders to traverse the first and last mile of their journey, distances that transit may not directly service.

DART, short for Dial-a-Ride Transit, is King County's suburban bus service. Due to lower population densities served, and thus more sparse service and smaller vehicles than RapidRide, DART provides riders with more flexible routes. Upon request, DART vehicles have the ability to go off route to pick up and drop off passengers. This allows DART vehicles to provide riders with direct access to outdoor recreation areas, such as the extensive backcountry trail system, within its defined service area, while bike racks allow riders to connect with areas that may even be slightly outside the service area. Just as RapidRide and Trailhead Direct, DART fares are consistent with the King County metro fare scale.

## Funding Initiatives

### *Parks, Recreation, Trails, and Open Space Levy*

In April of 2019, the King County Council approved the Parks, Recreation, Trails, and Open Space Levy, a five-year pilot initiative running from 2020-2025 to garner financial support for outdoor recreation areas. The levy taxes well-to-do King County residents who own property valued at \$500,000 or greater, \$7.60 a month, excluding residents living on fixed incomes, such as veterans, seniors, and disabled individuals. The program is projected to generate \$810 million over its six-year lifespan, allocating 39% (\$319 million) to the operation and maintenance of King County's existing 200 parks and 175 trails; 24% (\$193 million) to fund grant programs which aim to increase accessibility and equity by supporting cities, nonprofits, park districts, pools, park and trail capital investments, recreation programming, zoos, and aquariums; 20% (\$166 million) for expansion and connection of regional trails, namely the East Rail Corridor Trail and the Lake to Sound Trail; and 15% (\$121 million) to the protection of open space through acquisition and the support of recreation along river corridors (*Parks Levy Final Proposal*, 2019).

### *Youth and Amateur Sports Grant Program*

King County youth are less active than youth nationally, with only 19% of King County youth meeting CDC guidelines of 60 minutes of moderate activity a day in 2019 ("New Coalition to Address Lack of Access, Resources for Youth Physical Activity in King County," 2019). It was also found that youth of color and from low-income families are less likely to participate in organized physical activity and play a narrower range of sports than youth from wealthy white families (*State of Play Seattle King County*, 2019). Physical activity is crucial in physical and mental health, social emotional learning, and better educational outcomes, making it an ESJ determinant and pivotal in county success.

In 2019 alone King County granted 36 awards totaling \$2.4 million for projects such as free soccer programs for immigrant youth, athletic programs for urban native youth, and pool and ballfield improvements. The program is funded through a 1% car rental tax that was authorized in 1993.

### *Community Partnerships and Grants Program*

According to the King County ESJ plan, community partnership is a vital part of maintaining equitable public spaces. In efforts to leverage community partnerships from all walks of life within the county, King County operates the Community Partnerships and Grants Program to empower community partners to develop, program, maintain, or enhance public recreation facilities. Under this program the county provides the capital improvement grants to get each project on its feet, and the community partners provide additional capital and resources, and volunteer time to develop programs and facilities. Community partners usually maintain operation and programming through a longer-term agreement (*Community Partnerships and Grants - King County*).

## Takeaways for the Vermont Context

King County publicly recognizes the direct link between equity, transportation, and access to outdoor recreation, and effectively leverages equity-centered transportation and funding initiatives to increase this access. A few of these initiatives, rolled out within the VT state framework, would nicely complement the VT SCORP goal of increasing public access to outdoor recreation opportunities.

- **Equity Centered Plan:** While VT acknowledges the connection between equity and access to outdoor recreation opportunities, it doesn't acknowledge that this access disparity is merely a symptom of larger inequity issues. If VT can flip its narrative around increasing access to outdoor recreation on its head, centering efforts around structural drivers of inequity, it will find improvements in more than just recreation access, including health and education benefits. FPR could collaborate with the VT Agency of Education, an agency that already utilizes an equity-based approach, to tackle recreation access and education disparities in tandem from the same angle. By-and-large, VT would benefit from an established doctrine similar to that of the King County ESJ plan.
- **Off-Peak Transit to Service Trailheads and Parks:**
  - Chittenden County- Chittenden County has various public transit routes already in place, most of which originate in Burlington and extend outwards. Many of these routes operate more heavily during business hours to serve as a commuter service, among other things. In a similar fashion to King County's *Trailhead Direct*, Chittenden could utilize a number of these transit lines during non-peak times, such as weekends and holidays when folks tend to have more time to recreate, to bring people directly to trailheads. While the existing routes don't all directly service trails, transit routes can be amended to service recreation areas already located within two miles of routes or extend service to popular areas such as Mount Mansfield State Forest.
  - Mt. Ascutney and St. Johnsbury Regions- The Mt. Ascutney and St. Johnsbury regions are home to the *Rides to Wellness* pilot program, a program seeded to ensure VT residents have a means to access their health appointments. *Rides to Wellness* targets vulnerable populations such as low-income, elderly, or simply VT residents that need a hand. However, when the majority of health offices are closed during non-peak times such as weekends and holidays, *Rides to Wellness* fleets can be used to connect residents with recreation opportunities in their areas. Even though these programs are not centered on urban population hubs like Burlington, the transit "zone" concept utilized by King County's DART, in which riders may request access anywhere within a predetermined zone if feasible at the time, may be beneficial.
- **Open Space Levy:** If VT were to implement a levy similar to King County's Parks, Recreation, Trails, and Open Space Levy, it would allow well-to-do Vermonters to fuel the longevity and success of their prized possession: Vermont's forests. FPR could collaborate with the Vermont Housing and Conservation Board to amend the Vermont Housing and Conservation Trust Fund to include such a levy.

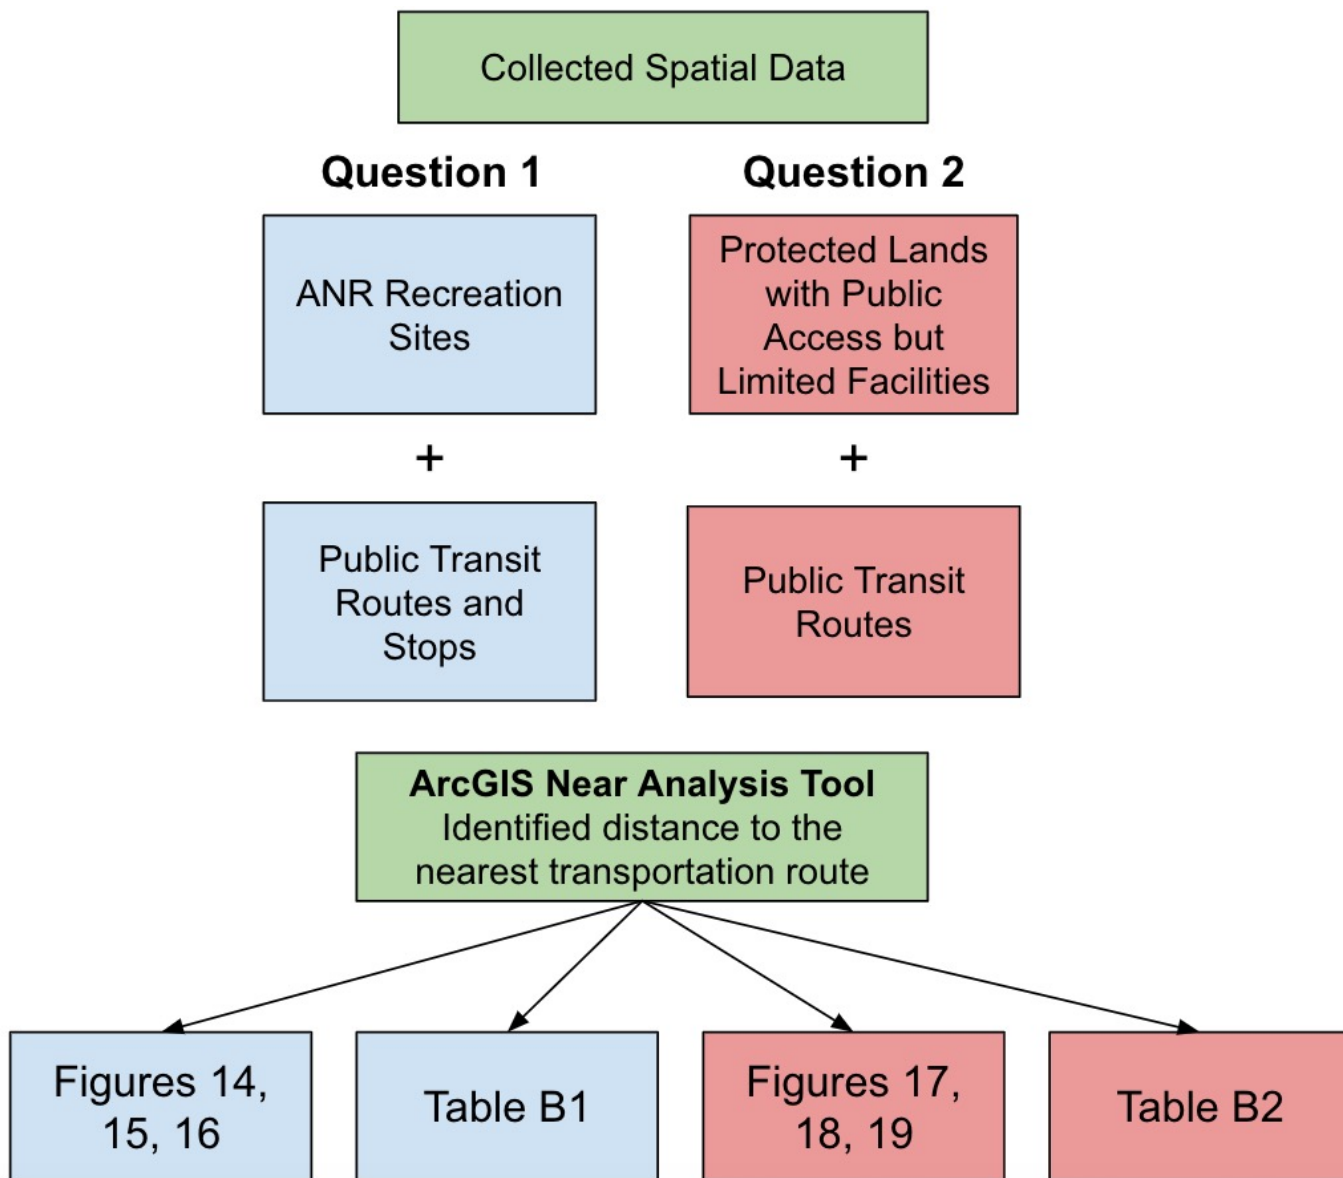

## **Part II: GIS Spatial Analysis**

### **Introduction**

In addition to developing case studies for how equity of access to recreational opportunities has been addressed elsewhere, we also conducted a spatial analysis to better understand how these issues take shape in Vermont. Using ArcMap, we overlaid public transportation routes and stops, recreation facilities, and public conserved land to identify two major gaps: one, areas where recreation opportunities exist but lack public transportation access and two, areas already accessible by public transportation that could be opened for recreation. This analysis serves as a starting point for identifying opportunities for improved transportation infrastructure and development of public lands for recreation.

### **Methods**

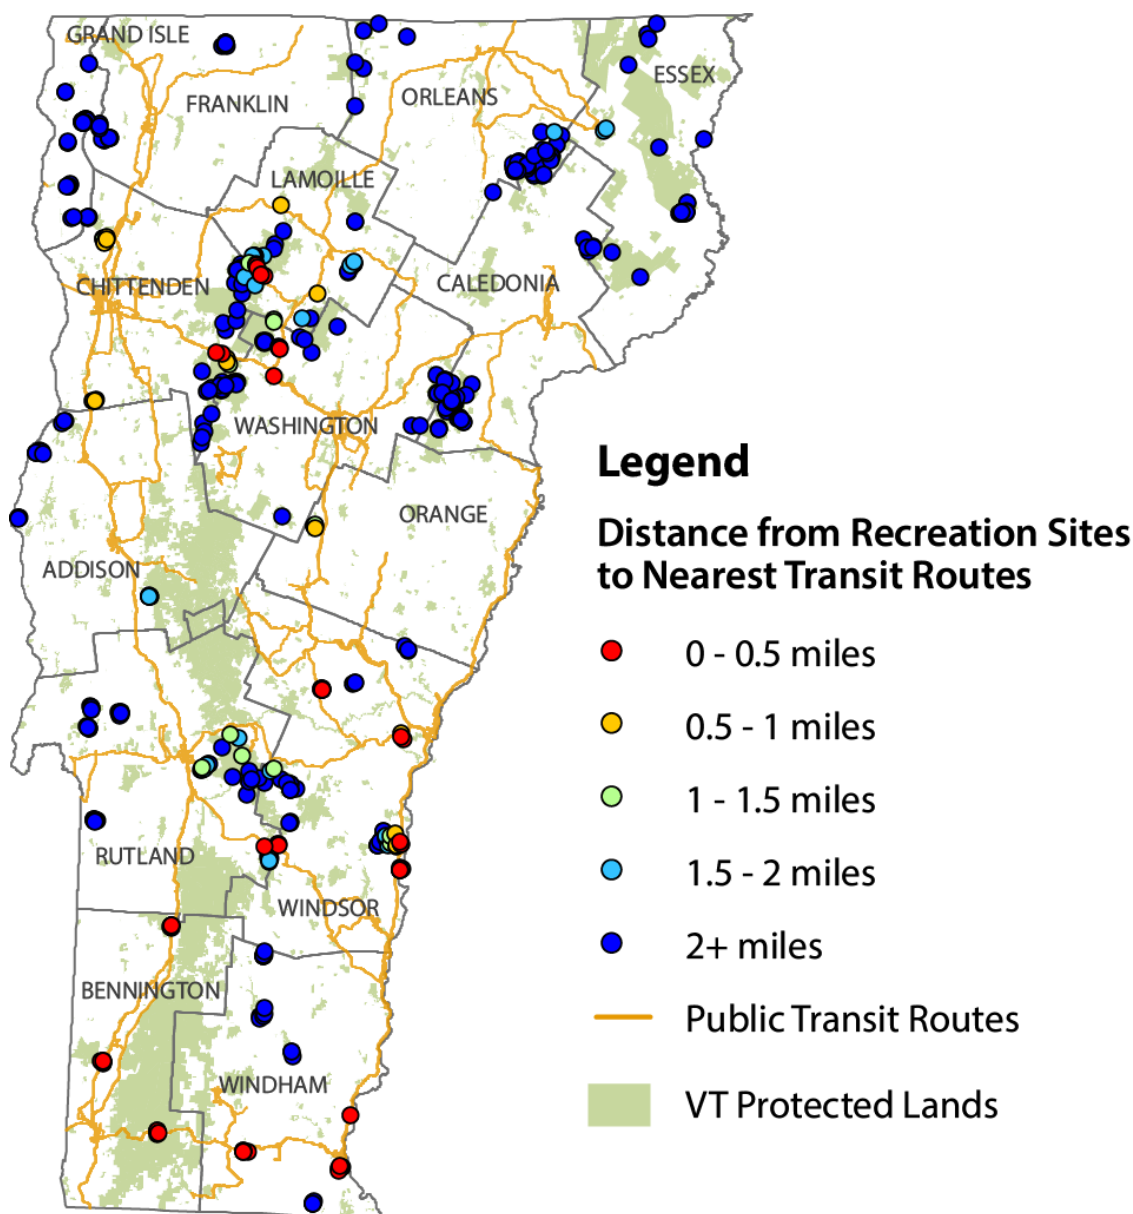

This section of the report employs a spatial analysis approach using ArcMap, a geospatial processing program. We combined various datasets from the Vermont Center for Geographic Information (VCGI) with a recreation sites dataset from the Vermont Agency of Natural Resources GIS - Open Data (VTANR Open Data) to produce maps and tables with ArcMap. The methods are organized by our two guiding questions: (1) where recreation opportunities but no public transportation access exist and (2) where public transportation access but no recreation opportunities exist. The analysis was conducted on a statewide level, but smaller-scale maps of Chittenden and Bennington Counties were also included to highlight findings in the counties with the most extensive public transit system and public lands, respectively.

**Figure 13.** Overview of ArcMap spatial analysis methods. In-depth methods are outlined in Appendix A.

## Gap Analysis Results

**Question 1: Where is there public access land with recreation opportunities but no public transportation access?**

**Figure 14.** State park recreation sites, shown by distance to nearest existing **public-transit routes**. Red sites, represented by points, are closer to routes while blue sites are farther away. Orange lines represent public transit routes. Green polygons represent recreation lands with public access. Table 1 below lists the number of sites in each distance category. North-central Vermont, near Mt. Mansfield National Forest and Camels Hump State Park, and south-eastern Vermont, near Ascutney State Park, showed relatively high concentrations of recreation sites within 0.5 miles of a transportation route. However, the majority of sites were over two miles from the nearest public transit route. Table B1 in Appendix B includes detailed information on all recreation sites within 2 miles of a public transit route.

**Table 1.** Number and percentage of recreation sites in each distance category from the nearest **public transit route**, as shown in Figure 14 above. There were more sites within 0.5 miles of a route than any of the three next highest distance categories. However, a large majority of sites (73%) were over two miles from the nearest public transit route, and thus not well served by public transportation.

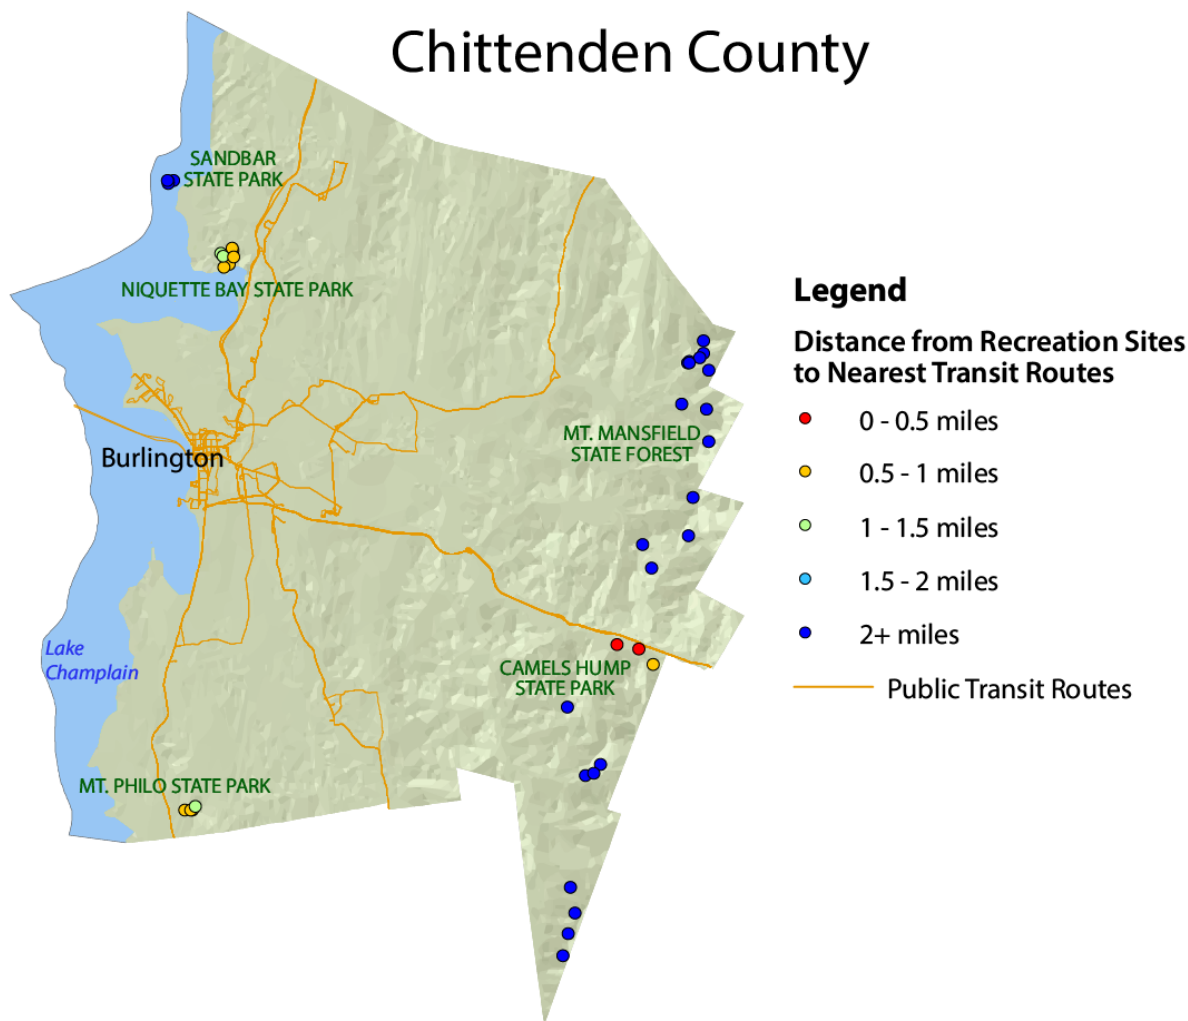

Distance (miles)	Number of Sites	Percent of Total Sites
0 - 0.5	62	12.30
0.5 - 1.0	23	4.56
1.0 - 1.5	17	3.37
1.5 - 2.0	36	7.14
2.0+	366	72.62

**It is important to note** that while some sites were within half a mile of a public transit route, the nearest public transit stop was often over two miles away. To address this difference, we also measured the distances between recreation sites and the nearest public transit stop, rather than just route. Out of every county, Bennington County had the most sites within half a mile of public transit stops, followed by Windham and Windsor Counties (Table 2). Detailed information on all recreation sites within two miles of a public transit route and their respective distances to public transit stops can be found in Table B1 in Appendix B.

**Table 2.** Percentage of recreation sites within 0.5 mile and 1 miles of an existing **public transit stop**. Results are ranked by the percentage of sites within 0.5 miles in each county. Bennington County had the highest percentage of sites within both distance categories. Washington County had a higher percentage of sites within the 0.5-mile range than Lamoille County, but fewer within the 1-mile range. Orange, Addison, Caledonia, Grand Isle, Franklin, Orleans, and Essex counties all had no sites within 1 mile of an existing public transit stop and were omitted from the table.

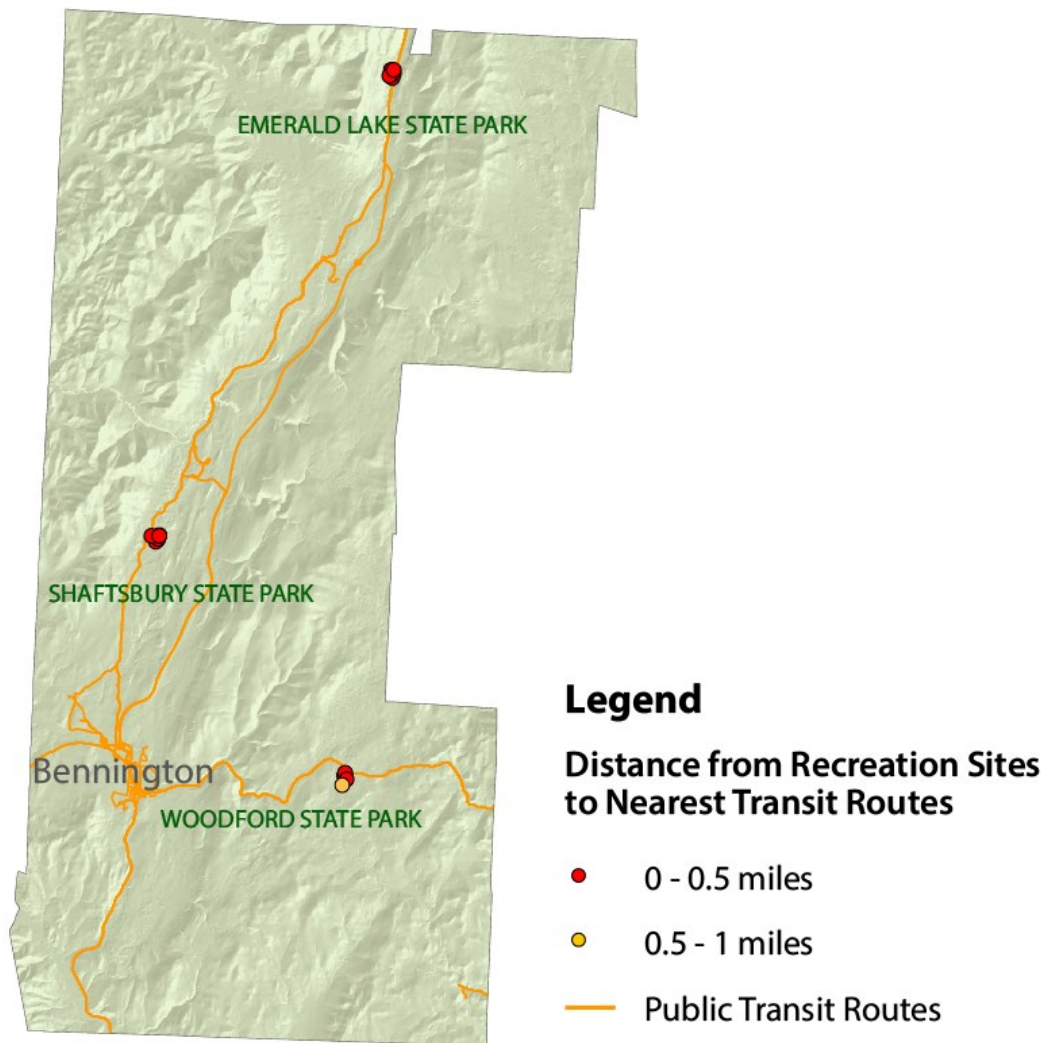

County	% sites within 0.5 mile	% sites within 1 mile
Bennington	47.37	63.16
Windham	23.33	33.33
Windsor	15.49	23.94
Washington	14.71	14.71
Lamoille	5.71	17.14
Chittenden	0	5.00
Rutland	0	1.85

To better visualize the data, the same recreation sites to public transit routes distance analysis is displayed on a county scale for both Chittenden and Bennington Counties below (Figures 15 and 16). Chittenden and Bennington Counties were selected for closer analysis because of their extensive public transit system and large amount of public access lands, respectively. In Chittenden County, most recreation sites were over two miles from public transit routes (Figure 15). Even the three sites in Camel’s Hump State Park that were close to an existing transit route were still over six miles from the nearest transit stop (Table B1). All sites in Bennington county were within one mile of an existing public transit route and within 1.5 miles of an existing public transit stop (Figure 16).

**Figure 15.** State-park recreation sites in Chittenden County, shown by distance to nearest existing public-transit routes. Red sites are closer to routes, while blue sites are farther away. Orange lines represent public transit routes. While three sites in Camel’s Hump State Park were within 1 mile of a public transit route, they were still over 2 miles from the nearest existing public transit stop. Similarly, several sites within the cluster near Niquette Bay State Park were within 1 mile of an existing route, but all were over 1 mile from the nearest transit stop. The sites near Mt. Philo State Park showed a similar pattern, however, they all remained within 1.5 miles of the nearest transit stop (See Table B1 in Appendix B).

# Bennington County

**Figure 16.** State park recreation sites in Bennington County, shown by distance to nearest existing public-transit routes. Red sites are closer to routes, while blue sites are farther away. Orange lines represent public transit routes. All sites in Bennington county were within 1 mile of an existing public transit route, so the other distance categories were omitted from the legend. All sites in Emerald Lake and Woodford State Parks were under one mile from the nearest public transit stop, and all sites in Shaftsbury State Park were within 1.5 miles of an existing stop.

## **Branbury State Park**

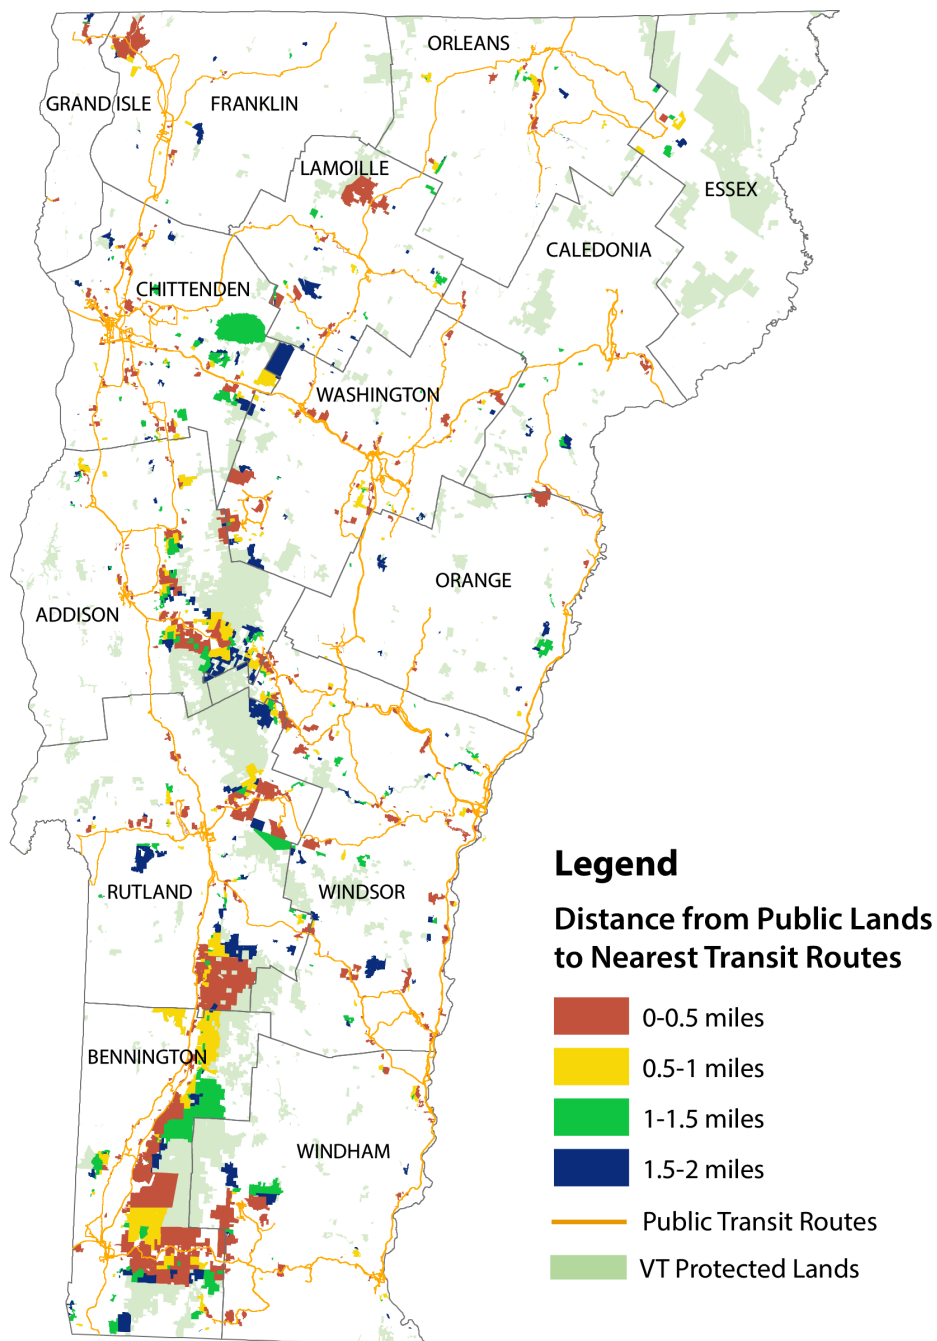

*Addison County*

Popular Recreation Site Not Served by Public Transportation

Branbury State Park in Addison County is an example of a popular recreation site not served by public transportation. Of all the state parks surveyed in 2018, it had the second highest visitation rate (Savage, 2016). However, it is still two miles from the nearest public transit route and over two miles from the nearest transit stop, a distance many are unable or unwilling to walk. This location presents an opportunity for FPR, in collaboration with the Department of Transportation, to develop aforementioned off-peak transit routes that increase access to a popular and well-developed park. However, it is also important to consider the ecological and infrastructural impacts of increasing visitation to an already popular state park. Besides Branbury State Park, there are 120 recreation sites one to three miles from existing public transit stops.

## Question 2: Where is there public access land with transportation but no recreation opportunities?

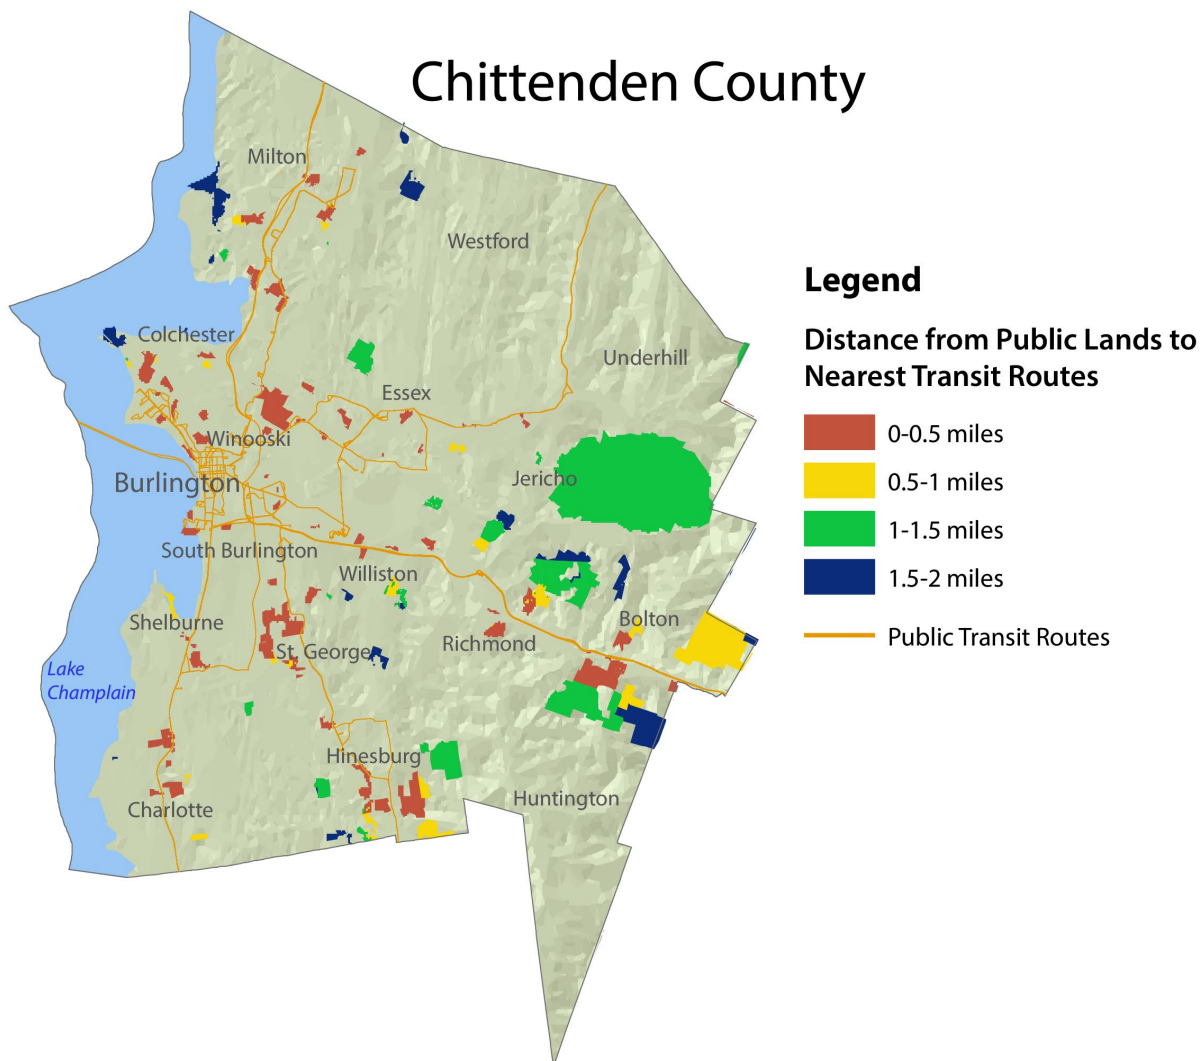

**Figure 17.** Protected land parcels with public access and limited facilities, shown by distance to nearest existing public-transit routes. Because of the lack of available statewide trailhead data, we conducted the Near analysis from individual protected lands parcels to transportation routes, rather than measuring the distance from their access points to routes. Only land parcels within a 2-mile radius of a public transit route are shown. Red parcels represent the most accessible land, located within 0.5 miles of a route. Below, Table 3 lists the number of parcels in each distance category. Accessible land with limited facilities is concentrated along routes in Bennington in the Green Mountain National Forest and with many small parcels along Vermont Route 125 in Addison County. A detailed table of all public access lands with limited recreation facilities within 0.25 miles of a transit route can be found in Table B2 in Appendix B.

**Table 3.** Number and percentage of parcels in each distance category from the nearest **public transit route**, as shown in Figure 17 above. About half of the parcels are located within 0.5 miles of a transit route. However, this table only provides data for the 2,167 parcels within 2 miles of the nearest public transit route, and there are 2,334 parcels located at a greater distance than 2 miles, making up 510,085.17 acres.

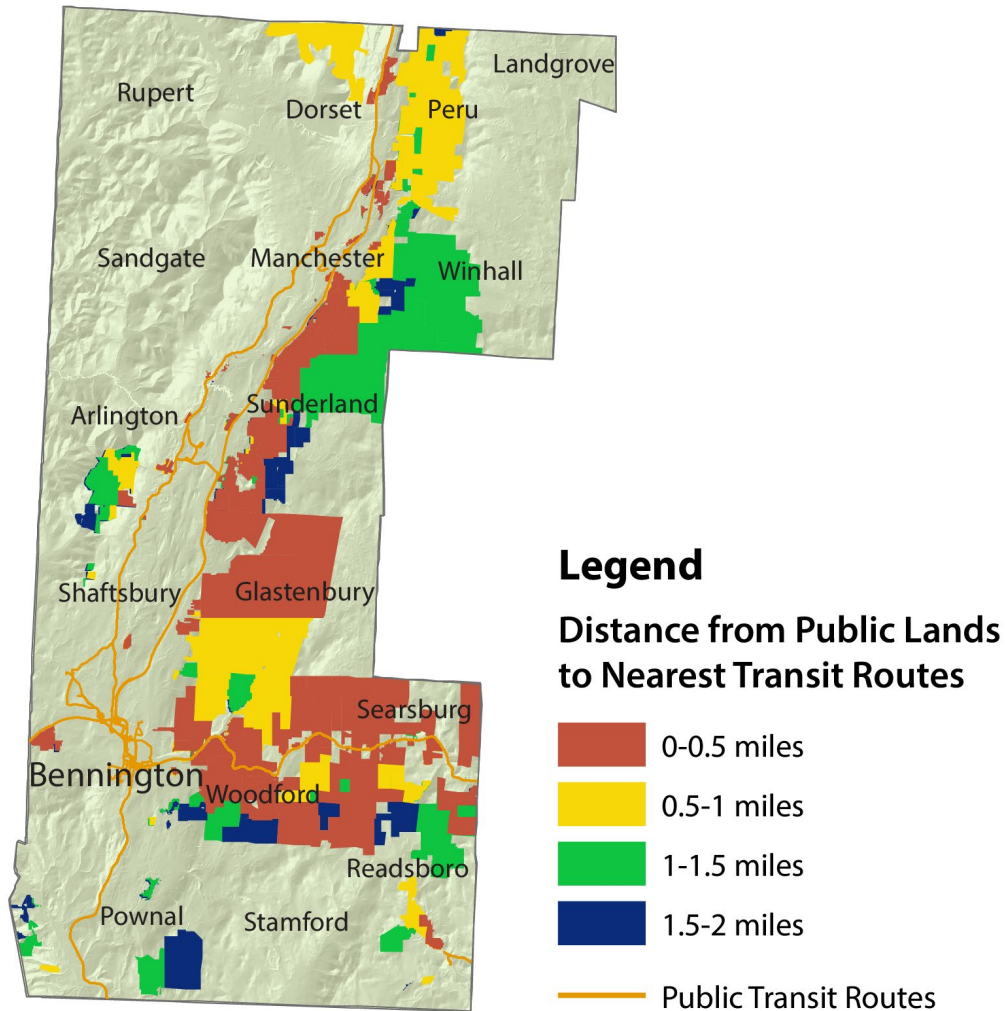

<b>Distance (miles)</b>	<b>Number of Parcels</b>	<b>% of Total Parcels within 2 miles</b>	<b>Acreage</b>
0 - 0.5	1049	48.41	176,769.62
0.5 - 1.0	425	19.61	69,756.25
1.0 - 1.5	354	16.34	71,620.85
1.5 - 2.0	339	15.64	65,455.04

The same public access parcels to public transit routes distance analysis is displayed on a county scale for both Chittenden and Bennington Counties (Figures 18 and 19) below to better visualize the data. In Chittenden County, the land parcels accessible by public transportation are fairly spatially dispersed (Figure 18). The parcels in Bennington County were very concentrated along the eastern side of Route 7 and along Route 9, following the Green Mountain National Forest (Figure 19).

**Figure 18.** Protected land parcels with public access and limited recreation facilities in Chittenden County, shown by distance to nearest existing public-transit routes. Only parcels within 2 miles are shown. Red parcels are closer to routes and more accessible than other parcels. Orange lines represent public transit routes. The parcels shown are fairly distributed throughout the county, with the most small, highly accessible parcels located in the towns surrounding the city of Burlington.

# Bennington County

**Figure 19.** Protected land parcels with public access and limited recreation facilities in Bennington County, shown by distance to nearest existing public-transit routes. Only parcels within 2 miles are shown. Red parcels are closer to routes and more accessible than other parcels. Orange lines represent public transit routes. The parcels shown are concentrated along the eastern half of the county, with a concentration of very accessible parcels along Route 9 running east-west.

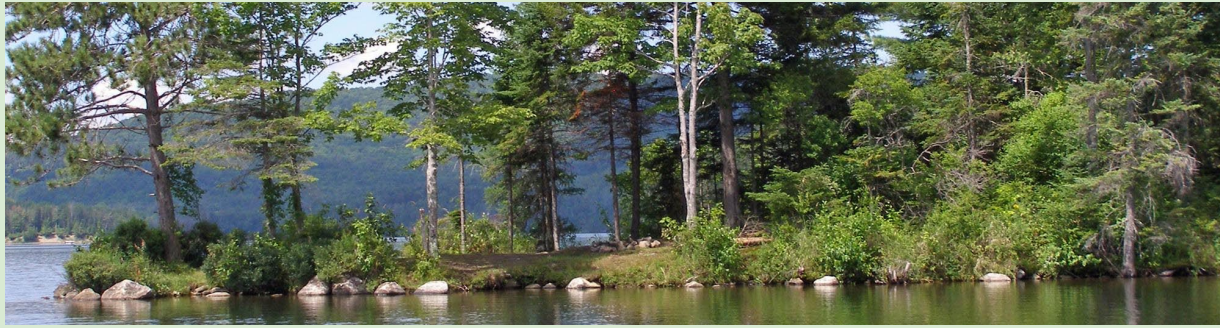

## **Molly's Falls Pond State Park**

*Washington County*

Highly Accessible by Public Transportation, Opportunity for Greater Recreation Access

From the results of our GIS analysis (Figure 17 and Table B2), we identified possible sites of improved recreation access. Molly's Falls Pond State Park in Marshfield, Vermont is one such example. It is a new state park, with a couple small campsites, picnic sites, and a boat launch with fishing platforms. The property is 1064 acres, including the 411-acre pond. This is an undeveloped state park with no phone or visitor facilities (Vermont State Parks, 2017). The park, located directly next to Route 2, would be highly accessible by public transit if a bus stop is established here or if passengers were allowed to request a stop here. There are also opportunities to develop visitor facilities, as well as trails and hiking. Besides Molly's Falls Pond State Park, there are 262 public access land parcels with limited recreational development within 0.01 miles from an existing public transit route. Some of these parcels are much smaller than the Molly's Falls Pond State Park parcels, but these small parcels often connect to other protected land parcels that should also be considered for recreation facility improvement.

## Spatial Analysis Takeaways

**Vermont's public access lands** are abundant and fairly well developed for recreation. Inadequate transportation access, rather than undeveloped trails or other recreational facilities, poses the greatest barrier to recreation access.

**Improving public transportation services** to existing recreation sites presents the greatest opportunity for increased access. In some instances, this means extending existing public transit routes, but in others, all that is needed is the creation of additional stops closer to existing recreation areas.

**There are 76 state park recreation sites** between 0.5 and 2.0 miles of existing public transit routes (Table B1) Each of these sites presents an opportunity for improved transportation access.

**There are 797 public access land parcels** (with limited or no trails or state park recreation sites) within 0.25 miles of existing public transit routes (Table B2). Each of these parcels presents an opportunity for improved recreation access. Creating new bus stops is one way to improve transportation infrastructure to serve parcels with recreation. These stops would most likely be served as “deviations” from the route due to inconsistent demand. Most rural transit systems in Vermont provide “deviated fixed-route” service to provide expanded access, and this option is open to all riders who request a deviated drop-off or pick-up. Commuter express routes are on tight schedules and are not required by the state to deviate by rider request, so adding a stop to these routes may require a different process.

**This analysis should be expanded** to include parking lots and their capacities as well as a more comprehensive recreation sites data layer. The analysis of lands served by public transportation with limited recreation access should also be refined to reflect the distances from routes to exact access points on the public lands parcels. Final recreation and transportation development recommendations should also take into account financial and infrastructural feasibility as well as proximity.

# Conclusions and Recommendations for Future Research

## Project Conclusions

1. **The GIS gap analysis** revealed over 70 recreation sites and almost 800 public access land parcels with opportunities for FPR to improve transportation and recreation infrastructure. These findings demonstrate that increasing equitable access to Vermont's public lands is well within reach, and may be as simple as adding stops to existing public transit lines.
2. **Access, Equity and Social and Environmental Impacts:** Even though we are mostly targeting Vermonters, any improvements to recreational opportunities will undoubtedly attract out of state visitation as well. Lessons from the case studies highlight the need for proactive management plans for public lands that take into account the ecological impacts of increasing access to certain areas, the ability of small Vermont communities to absorb increased visitation, and collaboration to successfully achieve goals of equity, access, and stewardship. To do this, it is crucial to understand the relationships between increased use and social and environmental impacts, and to use this understanding (which differs by place, type of recreation, type of visitor, etc.) to balance increased access with public land stewardship.
3. **Inadequate parking** at trailheads in Vermont is a symptom of a larger infrastructure problem that rural states like Vermont face. Improved public transportation access to recreation opportunities will mitigate parking challenges, while also reducing personal vehicle carbon emissions and diminishing barriers to access for those without vehicles.
4. **We want to acknowledge the impact of COVID-19** on disparities in equity and access to outdoor recreation and in our society at-large. The pandemic's pronounced effect on recreation in Vermont clarifies and reinforces the importance of an equity-centered approach to public lands management and recreation policy.

# **Recommendations for Future Research**

## **Case Studies**

We understand that in order to make our recommendations more robust and viable, supplementary research and information is necessary. Any continuation of this project would benefit from information as to where, based on public interests and wants, expanded recreation infrastructure would be favorable. While some of this information already exists and must be aggregated, some is to be collected via surveys, interviews, or focus groups. In addition, quantitative monetary data regarding transportation and recreation funding needs to be considered when making final recommendations.

## **Spatial Analysis**

Given the limited time and scope of our project, there are a number of ways that our spatial analysis could be extended and improved. First, because of the lack of trailhead and parking lot data, we conducted the Near analysis from individual protected lands parcels to transportation routes, rather than measuring the distance from specific access points to routes. Future analysis could involve creating an access point layer in order to conduct a finer-scale analysis of distance between the access points on public land parcels and transportation routes. Parcel data could also be better aggregated to link contiguous parcels with unified access or management. Another limitation of our analysis methods is that the distances from recreation sites to routes do not account for travel time. Future research could conduct a network analysis to account for speed limits and existing stops to better estimate the “distance,” including travel time, from the nearest transportation route. Additionally, much more comprehensive state-wide trail data, along with recreation site data for sites besides state parks could narrow the results, capturing less facilities with already existing recreation infrastructure. Further incorporating visitation and parking data could also enhance our understanding of existing recreation use and facilities. Combined with our spatial analysis, the above-listed information should be used to create a comprehensive assessment of identified recreation and transportation development opportunities that takes into account financial and infrastructural feasibility as well as proximity.

# Appendices

## Appendix A: GIS Methods

*Question 1:* Identifying gaps where recreation facilities exist but there is no transportation access to the land

First, we downloaded the Recreation Sites layer from Vermont Agency of Natural Resources GIS-Open Data, a feature layer that includes a broad range of recreation sites including parks, trailheads, swimming areas, ski areas, boat access points, and many other recreational features. This layer was last updated on August 15, 2019. Next, we downloaded two public transportation data layers from VCGI including: Public-Transit Routes from GTFS Data-Feeds and Public-Transit Stops from GTFS Data-Feeds. The two layers were downloaded on February 28, 2020, so they reflect the most comprehensive statewide routes and stops before temporary closures came into effect due to COVID-19. The routes layer includes route and transit agency information.

We used the Near analysis tool in ArcMap to calculate distance between the input feature, recreation sites, and the closest feature in the public transit routes layer. The Near tool added two new fields into the attribute table of recreation sites, NEAR\_FID, the object ID of the closest Near feature, and NEAR\_DIST, the distance between the input feature and the Near feature. We used the Near analysis tool again with recreation sites as the input feature and the public transit stops layer as the Near feature, to add two new fields into another copy of the recreation sites layer. With these two new fields in each copy of the Recreation sites layer's attribute table, maps and tables were created showing the distance from recreation site points to transportation routes and stops. For the table, the transit route layer data was joined by FID to the NEAR\_FID field in the Recreation Sites layer in order to display transit route and agency information connected to each recreation site. The maps and tables display distance going up by 0.5 miles in intervals: 0.5-1 miles, 1-1.5 miles, 1.5-2 miles, 2+ miles.

*Question 2:* Identifying gaps where public transportation access exists near land with public access, but the land does not have any recreation facilities

Second, we downloaded the Vermont Protected Lands Database, a layer of parcels that are presently protected from development by way of public ownership, private ownership, or other protection mechanisms including conservation easements, from VCGI. The database was last updated on July 31, 2019. This database includes attributes with information on agency, public access, land designation, and the level of government controlling the land. In order to refine this data, we deleted all parcels listed as "No Public Access" within the PUBACCESS field. The parcels listed with "Private Conserved Land" in the SymbolPAgency field and the DESIGNAT field were also deleted. The parcels that intersected with the VT ANR's Recreation Sites layer and VCGI's VT Data- E911 Trails layer were deleted, in order to remove parcels with these recreation facilities that already exist.

We ran the Near Analysis tool with the refined Protected Lands data layer as the input feature and the public transit routes layer used previously as the Near feature. We added a two-mile search radius to the analysis, so that only land parcels within 2 miles of transportation routes or stops would be identified in each

case. Two new columns were added into the protected lands layer, NEAR\_FID and NEAR\_DIST, and maps were created displaying the distance from lands with public access to transportation routes. The maps display distance going up by 0.5 miles in intervals: 0.5-1 miles, 1-1.5 miles, 1.5-2 miles. After creating maps, we generated a table with the same data. The transit route layer data was joined by FID to the NEAR\_FID field in the Protected Lands layer in order to display transit route and agency information connected to each parcel. Due to the size of the dataset, it was refined to only parcels within 0.25 miles of a transit route.

## Appendix B: Supplemental GIS Tables

**Table B1.** State park recreation sites within 2 miles of a public transit route, sorted and color-coded by distance. Colors correspond to the distance thresholds on Figures x, y, and z: Red = 0- 0.5 miles, Orange = 0.5 - 1 miles, Green = 1 - 1.5 miles, Light Blue = 1.5 - 2 miles.

Site Name	ANR Unit	ANR District	Type	Distance to Nearest Route (miles)	Distance to Nearest Stop (miles)	Nearest Route ID	Nearest Route Name	Nearest Stop ID	Nearest Stop Name	Transit Agency
